

PROBLEM STATEMENT 2

THE BHARAT BIZ-AGENT

SUBTITLE: BRIDGING THE DIGITAL DIVIDE WITH AUTONOMOUS AI OPERATIONS.

CONTEXT & BACKGROUND

India is home to over 60 million Small and Medium Businesses (SMBs) contributing nearly 30% of the nation's GDP. However, for many business owners, the primary hurdle to growth is not a lack of ambition, but a challenge with **Digital Fragmentation & Operational Friction**.

In the daily life of an Indian business owner, this manifests as:

- **The "Tool Fatigue" Wall:** Business owners are forced to juggle disconnected silos (WhatsApp for orders, Tally for accounting, Excel for inventory). The gap between "receiving an order" and "logging it" involves manual, error-prone data entry.
- **Language & Interface Barriers:** Most Enterprise SaaS tools are "English-First" and desktop-centric. For a mobile-first merchant comfortable in Hindi, or Hinglish, complex dashboards create an insurmountable accessibility wall.
- **Operational Bottlenecks:** The daily reality of running an SMB is plagued by high-friction administrative chaos ranging from the revenue leakage of untracked 'Udhaar[Credit]' ledgers and the nightly struggle of manually reconciling fragmented UPI screenshots to the recurring anxiety of strict GST compliance which collectively drains cognitive energy and diverts critical focus from business expansion.

THE CHALLENGE

Build The Bharat Biz-Agent, an autonomous "Co-Pilot" that deconstructs complex business workflows into simple, conversational actions. The goal is to move beyond generic chatbots to Action-Oriented Agents that execute real work generating invoices, chasing payments, and updating inventory through the interfaces users already love (e.g., WhatsApp, Web Based Applications).

TECHNICAL CONSTRAINTS AND REQUIREMENTS

USERPROFILING AND REQUIREMENT

A. . Localization & Cultural Context

The AI must not be a generic western model. Solutions must prioritize the specific linguistic and cultural landscape of India:

- **Multilingual & Code-Mixed Support:** The system must accurately process mixed-language inputs (e.g., "Kal payment bhej dena," or Hinglish). It must handle regional accents and colloquialisms specific to Indian trade.
- **India-Specific Logic:** The agent must understand local business contexts (e.g., GST slabs, UPI payment flows, informal credit cycles) to ensure the outputs are legally and culturally valid.

B. Integration & Autonomy

- **The "WhatsApp-First" Standard:** Since WhatsApp is the operating system of Indian business, the agent must function primarily through chat interfaces (WhatsApp/Telegram). Teams must demonstrate how the agent bridges the gap between unstructured chat and structured databases (CRMs/ERPs).
- **Human-in-the-Loop Safety:** For sensitive actions (e.g., sending an invoice or filing a tax report), the agent must act as a drafter, requiring a simple "Yes/No" confirmation from the human before execution.

C. Latency & Performance

- **The Connectivity Reality:** The solution must function robustly even in Tier-2/Tier-3 cities with fluctuating internet speeds. Lightweight architecture is preferred over heavy, data intensive dashboards.

D. Frictionless UI/UX

- **Voice-First Interaction:** Typing on a mobile screen is a friction point for many traders. The primary input method should be Voice (Speech-to-Text) with high accuracy for Indian vernaculars. (English, Hindi or Hinglish)
- **Zero-Training Interface:** Avoid complex menus. The user should be able to say, "Send a bill to Rahul for 500 rupees," and the agent handles the rest.

KEY FEATURES TO INCLUDE

- **Autonomous Task Execution:** Agents that don't just "chat" but "do" [e.g., autonomously creating a PDF invoice and emailing it].
- **Unstructured Data Processing:** Ability to read a photo of a handwritten bill or a voice note and convert it into structured digital entry.
- **Context-Aware Follow-ups:** Proactive agents that nudge the owner: "Rahul hasn't paid for 30 days. Should I send a reminder on WhatsApp?"

JUDGING CRITERIA

Criteria	Weight	What Judges Look For
Industry Relevance & Depth	30%	Is the agent tailored to a specific sector (e.g., Textile, Pharma, Retail) with deep domain knowledge?
India-First Engineering	25%	Quality of vernacular language handling (Hindi/Hinglish NLP) and code-mixing capability.
Actionability (Agentic AI)	20%	Does the AI actually <i>execute</i> the task (API calls, database writes) or just give advice?
Integration Complexity	15%	How smoothly does it connect unstructured chat (WhatsApp) to structured backends (ERP/CRM)?
Trust & Safety	10%	Are there guardrails to prevent financial hallucinations or data leaks?

IMPACT GOAL OF PS2

Success is measured by Operational Autonomy. By reducing the time spent on "Life Admin" and manual paperwork, we empower Indian SMBs to focus on growth and strategy, leveling the playing field against larger enterprises.
